Cheat Sheet: API's and Data Collection

```
Package/Method Description
                                                                                                       Code Example
                               Syntax:
                                  1. 1
                                  1. attribute = element[(attribute)]
                 Access the
                 value of a
                                Copied!
Accessing
                 specific
element attribute
                 attribute of an
                               Example:
                 HTML
                 element.
                                  1. 1
                                  1. href = link_element[(href)]
                                Copied!
                               Syntax:
                                  1. 1
                 Parse the
                 HTML content
                                  1. soup = BeautifulSoup(html, (html.parser))
                 of a web page
                                Copied!
                 using
BeautifulSoup()
                BeautifulSoup.
                                Example:
                 The parser
                 type can vary
                 based on the
                 project.
                                  1. html = (https://api.example.com/data) soup = BeautifulSoup(html, (html.parser))
                                Copied!
                               Syntax:
                 Send a
                 DELETE
                                  1. 1
                 request to
                                  1. response = requests.delete(url)
                 remove data or
                 a resource
                                Copied!
                 from the
delete()
                 server.
                                Example:
                 DELETE
                 requests delete
                 a specified
                                  1. response = requests.delete((https://api.example.com/delete))
                 resource on
                 the server.
                                Copied!
                               Syntax:
                                  1. 1
                                  1. element = soup.find(tag, attrs)
                 Find the first
                 HTML
                                Copied!
                 element that
find()
                 matches the
                                Example:
                 specified tag
                 and attributes.
                                  1. first_link = soup.find((a), {(class): (link)})
                                Copied!
                               Syntax:
                                  1. elements = soup.find_all(tag, attrs)
                 Find all
                 HTML
                                Copied!
                 elements that
find_all()
                 match the
                               Example:
                 specified tag
                 and attributes.
                                  1. all_links = soup.find_all((a), {(class): (link)})
                                Copied!
findChildren()
                 Find all child
                               Syntax:
                 elements of an
                 HTML
                 element.
                                  1. children = element.findChildren()
                                Copied!
                               Example:
                                  1. 1
```

```
1. child_elements = parent_div.findChildren()
                                Copied!
                 Perform a
                 GET request
                 to retrieve data
                 from a
                                Syntax:
                 specified
                                   1. 1
                 URL. GET
                 requests are
                                   1. response = requests.get(url)
                 typically used
                                Copied!
                 for reading
                 data from an
get()
                                Example:
                 API. The
                 response
                                   1. 1
                 variable will
                 contain the
                                   1. response = requests.get((https://api.example.com/data))
                 server's
                 response,
                                 Copied!
                 which you can
                 process
                 further.
                                Syntax:
                 Include
                 custom
                                   1. 1
                 headers in the
                 request.
                                   1. headers = {(HeaderName): (Value)}
                 Headers can
                                Copied!
                 provide
Headers
                 additional
                 information to Example:
                 the server,
                 such as
                 authentication
                                   1. base_url = (https://api.example.com/data) headers = {(Authorization): (Bearer YOUR_TOKEN)} response = requests.get(bas
                 tokens or
                                Copied!
                 content types.
                                Syntax:
                 Import the
                 necessary
                                   1. 1
Import Libraries
                 Python
                                   1. from bs4 import BeautifulSoup
                 libraries for
                 web scraping.
                                Copied!
                 Parse JSON
                 data from the
                 response. This Syntax:
                 extracts and
                                   1. 1
                 works with the
                                   1. data = response.json()
                 data returned
                 by the API.
                                Copied!
                 The
                 response.json() Example:
json()
                 method
                 converts the
                                   1. 1
                 JSON
                                   2. 2
                 response into a
                                   1. response = requests.get((https://api.example.com/data))
                 Python data
                                   2. data = response.json()
                 structure
                 (usually a
                                 Copied!
                 dictionary or
                 list).
                                Syntax:
                                   1. sibling = element.find_next_sibling()
                 Find the next
                                Copied!
                 sibling
next_sibling()
                 element in the Example:
                 DOM.
                                   1. next_sibling = current_element.find_next_sibling()
                                Copied!
parent
                 Access the
                                Syntax:
                 parent element
                 in the
                 Document
                                   1. parent = element.parent
                 Object Model
                 (DOM).
                                 Copied!
```

Example:

```
1. parent_div = paragraph.parent
                                   Copied!
                   Send a POST
                  request to a
                                  Syntax:
                   specified URL
                   with data.
                   Create or
                                     1. response = requests.post(url, data)
                   update POST
                  requests using Copied!
post()
                   resources on
                   the server. The Example:
                  data parameter
                   contains the
                   data to send to
                                     1. response = requests.post((https://api.example.com/submit), data={(key): (value)})
                  the server,
                  often in JSON Copied!
                  format.
                  Send a PUT
                  request to
                                  Syntax:
                  update data on
                  the server.
                  PUT requests
                                     1. response = requests.put(url, data)
                  are used to
                  update an
                                   Copied!
                   existing
put()
                  resource on
                                  Example:
                  the server with
                  the data
                                     1. 1
                  provided in the
                                     1. response = requests.put((https://api.example.com/update), data={(key): (value)})
                  data
                  parameter,
                                   Copied!
                  typically in
                  JSON format.
                                  Syntax:
                  Pass query
                                     1. params = {(param_name): (value)}
                   parameters in
                   the URL to
                                   Copied!
                  filter or
                  customize the Example:
Query parameters request. Query
                  parameters
                                      1. 1
                   specify
                                     2. 2
3. 3
                   conditions or
                  limits for the
                                     1. base_url = "https://api.example.com/data"
2. params = {"page": 1, "per_page": 10}
3. response = requests.get(base_url, params=params)
                  requested data.
                                   Copied!
                                  Syntax:
                                     1. 1
                                     1. element = soup.select(selector)
                   Select HTML
                                  Copied!
                   elements from
select()
                  the parsed
                  HTML using a Example:
                   CSS selector.
                                     1. titles = soup.select((h1))
                                   Copied!
                   Check the
status_code
                                  Syntax:
                  HTTP status
                   code of the
                  response. The
                                     1. response.status_code
                  HTTP status
                   code indicates Copied!
                  the result of
                                  Example:
                  the request
                  (success, error,
                                      1. 1
                  redirection).
                                     2. 2
3. 3
                   Use the HTTP
                  status codeIt
                   can be used for
                                     1. url = "https://api.example.com/data"
                                     2. response = requests.get(url)
